

SALES PERFORMANCE ANALYSIS

1. PROJECT OVERVIEW

This project analyses sales data using Microsoft Excel to evaluate overall sales performance and identify key patterns across products, sales representatives, cities, and months. The analysis focuses on key performance indicators including Revenue, Cost of Goods Sold (COGS), Profit, and Customer count. Pivot Tables, charts, and interactive Region and Category slicers were used to present the analysis in a dashboard.

2. DATA CLEANING & PREPARATION

The raw sales data was reviewed for missing values, consistency, and data structure before analysis. The data was cleaned and prepared using Excel and Power Query, with calculated fields for Cost Price, Revenue, COGS, and Profit. The prepared data was then used to create Pivot Tables for further analysis and dashboard development.

3. ANALYSIS & DASHBOARD

Pivot Tables were used to analyse sales performance across key business dimensions, including product, sales representative, city, and customer performance. The results were presented in an interactive Excel dashboard containing KPI cards, charts, and Region and Category filters to support quick exploration of the sales data.

4. KEY FINDINGS

4.1 Product Profitability

- **Laptop A13** generated the highest profit among the products displayed, with a profit of **105.34 million**.

- **Sofa Classic** and **Desktop PC D21** followed with approximately **69.25 million** and **68.64 million** respectively.
- **Blender B10** recorded the lowest profit among the products displayed, at approximately **6.87 million**.

4.2 Sales Representative Performance

- **Peter** recorded the highest revenue among the sales representatives displayed.
- **Musa** followed with approximately **397.67 million** in revenue.
- **David** and **Aisha** generated similar revenue levels of approximately **378.56 million** and **378.04 million** respectively.
- **Grace** recorded approximately **367.84 million** in revenue among the representatives displayed.

4.3 City-Level COGS

- **Lagos** had the highest COGS at approximately **493.81 million**.
- **Sano** followed with approximately **485.79 million**.
- **Port-Harcourt** recorded approximately **458.78 million**.
- **Abuja** had the lowest COGS among the cities displayed, at approximately **423.31 million**.

4.4 Customer Performance by Month

- **April** recorded the highest customer counts among the months displayed for both Corporate and Retail customers.
- Corporate customers peaked at **285 in April**, while Retail customers peaked at **279 in January**.

- Customer counts dropped sharply in **May**, with approximately **10 Corporate** and **5 Retail** customers shown.

5. BUSINESS INSIGHTS & RECOMMENDATIONS

5.1 Focus on high-profit products

Laptop A13 contributes substantially more profit than the other products displayed. The business can examine what is driving its stronger profitability and use those insights when planning inventory and sales strategies.

5.2 Review lower-profit products

Products such as Blender B10 and Microwave M20 generate considerably less profit than the leading products. Their pricing, sales volume, and cost structure should be reviewed to determine whether they require repositioning or cost adjustments.

5.3 Investigate city-level cost differences

Lagos has the highest COGS among the cities shown, while Abuja has the lowest. Since COGS alone does not indicate profitability, management should compare these costs with revenue and profit by city before making decisions about resource allocation.

5.4 Learn from high-performing sales representatives

Peter leads the displayed sales representatives in revenue. Reviewing the products, customers, regions, and sales approaches associated with stronger sales performance could help identify practices that can be replicated across the wider sales team.

5.5 Investigate the May customer decline

Customer counts fall sharply in May compared with the preceding months. Because the dashboard covers only part of the year, this should first be investigated to determine

whether it reflects an actual decline, incomplete data, or another business factor before drawing conclusions.

5.6 Use dashboard filters for targeted decisions

The Region and Category slicers allow management to examine performance from different perspectives. This makes it easier to investigate specific regions or product categories rather than relying only on overall figures.

6. PROJECT OUTCOME

The project resulted in an interactive Excel sales performance dashboard that brings together key sales, profitability, cost, product, sales representative, city, and customer performance metrics. The dashboard enables users to explore the data using Region and Category filters and provides a clear view of sales performance to support data-driven business decisions.
